

SEACREST FIELD

Seacrest Field is a 5,000 seat outdoor stadium within the Seacrest Athletic Complex in Lincoln, Nebraska. The stadium is used for various high school activities such as football and soccer games, as well as convocation exercises.

As part of an overall stadium improvements project that also included concessions and lighting, CFA designed and commissioned a new sound reinforcement system. Our design goal was to hear and understand announcements and music in every seat of the stadium using a system that provides user-friendly operation.

The sound reinforcement system utilizes a distributed design concept with loudspeakers installed on former lighting poles for uniform sound distribution. The system includes a sound system operating location within the press booth. A simple mode select switch enables the system to be configured for sports or convocation modes.
